dJONt Quick Start

Install it, hear it, and get the good sounds in about 5 minutes. Windows 10 / 11, 64-bit.

dJONt: a pedalboard plugin that goes in front of your amp sim. Wham, Sustain, Tight, Grit, Sub, Lo-Fi.

1 · Install

1. Run **dJONt-v...-windows-x64.exe**.
2. Windows may show **"Windows protected your PC"**. That's because this is an unsigned hobby build, not a store app. Click **More info**, then **Run anyway**.
3. Leave both parts ticked: the **VST3 plugin** (for your DAW) and the **standalone app** (runs on its own, no DAW needed). Click Install.

WHAT	WHERE IT GOES
VST3 plugin	`C:\Program Files\Common Files\VST3\dJONt.vst3` (where every DAW looks)
Standalone app	`C:\Program Files\dJONt\dJONt.exe`, plus a Start menu shortcut
These guides	Start menu → **dJONt** folder: *Quick Start* and *Manual*

2a · Use it in a DAW

1. **Reaper:** Options → Preferences → Plug-ins → VST → **Re-scan**. Other DAWs: rescan VST3 plugins in their plugin settings (most do it on startup).
2. Add **dJONt** to your guitar track **before** your amp sim (T3KJ, Neural, NAM, anything). It's a pedalboard: guitar → dJONt → amp.

2b · Or use the standalone app

1. Start menu → **dJONt**. Click the **gear** (top right).
2. Audio device type **ASIO** (lowest latency), then your audio interface. Tick the **input your guitar is on**, pick the outputs to your speakers. Buffer: 64 or 128.
3. Turn on **Hear yourself**. It's off by default (to avoid feedback), and it's the #1 reason for "no sound".

The standalone app is just dJONt, no amp sim, so you'll want it going into an amp, a modeler, or an amp-sim app. In a DAW you get the full chain on one track.

3 · Five minutes of good sounds

TRY	DO THIS	YOU'LL HEAR
Tight	It's on by default. Play palm mutes; turn **Amount** up. Or flip it to **FOCUS** for a tight boost.	Chugs that hit harder and stop sooner, or a tighter amp.
Wham	Click Wham's power light. Then **Presets → Dive Bomb** or **Siren**.	A whammy pedal that moves by itself, no pedal needed.
Wham, by hand	Click **PEDAL**, INTERVAL **Oct Up**, drag the rocker up toward TOE.	The classic octave squeal.
Hold	Sustain on, **HOLD** mode. Strum a chord, click **HOLD**, then play over it.	A frozen pad under your playing, like a piano's sustain pedal.
Sustainer	Sustain → **SUSTAINER**, type **HARM**. Hold a single note.	The note keeps ringing, then blooms up an octave.
Sub	Sub on, **CLEAN**, Blend 40%.	An octave below, like a bass player doubling you.
Lo-Fi	Lo-Fi on for an intro, then switch it off.	Telephone / radio sound that opens up on the drop.
Hush	Click **HUSH**, turn it ON, hands off the strings, click **LEARN**. Raise Strength.	Hiss gone between and under notes, no latency.

4 · Getting around

DO THIS	TO
Hover anything	Read what it does (and its value) in the bar at the bottom.
Click ?	Open the manual inside the plugin: every module, how it works, what it's for, things to try.
Drag a knob up / down	Turn it. **Double-click** resets it.
ADV	Flip Wham or Sustain to their extra voicing controls.
Right-click a control	MIDI Learn: put it on a footswitch or expression pedal.
Drag the bottom-right corner	Resize the window (60% to 200%).

5 · If something's off

PROBLEM	TRY THIS
DAW doesn't list dJONt	Rescan VST3 plugins. Check `C:\Program Files\Common Files\VST3\dJONt.vst3` exists (re-run the installer with VST3 ticked).
No sound in the standalone app	Gear → **Hear yourself** on; your guitar's input ticked; outputs go to your speakers.
Late with Wham on / crackles	Wham adds a few ms (pitch shifting); turn it off when you're not using it. Crackles: bigger buffer (128 or 256).
Uninstall	Windows Settings → Apps → dJONt → Uninstall.

> **Want the deep dive?** Start menu → dJONt → **Manual** (PDF): Wham's Whammy modes and presets, Hold vs Sustainer, footswitches and MIDI, and every control explained.
